

The birds within the free range unit will graze the designated land in a rotational field system. The birds will step out of the building through the pop holes provided and onto a veranda, which shall ensure that the ground is not poached and compacted by the birds. The veranda shall also ensure that the feet of the birds are cleaned prior to entering the building. The birds will then be directed to those fields available for grazing in rotation to prevent over stocking of the ground and ensure the fertility of soil. Good pasture management is essential, and it is paramount the problems of parasitic intestinal worms and coccidian oocysts are avoided. Electric fencing shall surround the ground used as part of the enterprise to prevent predators entering onto the land.

All hedgerows within the Range area will be double fenced with chicken stock proof fencing. The range area field boundaries are 90% hedgerows and the business wish to protect them. The hedgerow boundaries also act as shelter for the birds therefore it is important to protect them.

All watercourses will be fenced out using chicken fencing to prevent the birds damaging the watercourses and bank structures. Also, to prevent pollution of the watercourse.

Land drains will be placed where the ranging area slopes towards any sensitive water receptor to make sure that no sediment goes into the water and that it remains in the field.
