

All watercourses will be fenced out using chicken fencing to prevent the birds damaging the watercourses and bank structures. Also to prevent pollution of the watercourse.

The range area extends to 16.25 hectares (40.15 acres) for the 32,000 bird unit.

The birds within the free range unit will graze the designated land in a rotational field system. The birds will step out of the building through the pop holes provided and onto a veranda, which shall ensure that the ground is not poached and compacted by birds. The veranda shall also ensure that the feet of the birds area cleaned prior to entering the building.

The birds will be then directed to those fields available for grazing on rotation to prevent over stocking of the ground and ensure the fertility of the soil. Good pasture management is essential, and it is paramount that the probelism of parasitic intestinal worms and coccidian oocysts are avoided. Electric fencing shall surround the ground used as part of the enterprise to prevent predators entering onto the land.
