Manure Management Plan for Poultry units Land South East of Neuadd Isaf, Pen Y Bont, Llandrindod Wells, Powys, LD1 5SW

For the manure management plan for the installation, all manure will be exported off site, of which agreements are in place with business' to take a minimum amount a year to ensure all manure is dealt with accordingly.

These will require to spread manure in line with the water pollution legislation, SSAFO and COGAP.

APPLICATION METHODS

Manure will be stored and spread in accordance with the water, soil and air Codes of Good Agricultural Practice.

Manure will be stored in manure stores at the holding or transported immediately to the business' that spread the manure.

Contingency plan - There are a number of covered areas on the farm to allow for storing any manure, slurry and dirty water produced at times when spreading may not be possible e.g. due to wet, waterlogged or frozen conditions in accordance with the Code of Good Agricultural Practice. This is to ensure manures and slurry are spread at appropriate times to prevent pollution and maximise uptake of nutrients for crop growth.

Wash water will be stored in a dirty water tank below ground which will be compliant with SSAFO Regulations (Wales) 2010 standards and be of sufficient capacity to cope with the build-up of wash water. Once this reaches capacity, it will either be spread on the land directly from a slurry tanker, or taken to the existing slurry pit, which complies with SSAFO regulations.

During and after a potential disease outbreak, the wash water from the unit will be collected by a specified waste services company or a permitted anaerobic digester, which would take the 'hazardous waste' off the farm and dispose of correctly. This will ensure any contaminated wash water/slurry from the outbreak will be kept separate from other manures/slurry on the farm.
